## Assignment #9 CS 3060 Programming Languages, Fall 2020 Instructor: Dr. Roy

## Scala-Haskell

**Due Date:** Dec 4 (Fri) @ 11.59 PM.

**Total Points:** 60 points

**Note:** This is an extra assignment, which may help you improve your grade as we will be picking up your best 8 assignments out of 9 assignments.

**Directions:** Using the source provided via Gitlab https://gitlab.com/sanroy/fa20-cs3060-hw/, complete the assignment below. The process for completing this assignment should be as follows:

- $1. \ \ You \ already forked the Repository "sanroy/fa20-cs3060-hw" to a repository "yourId/fa20-cs3060-hw" under your username. If not, do it now.$
- 2. Get a copy of hw9 folder in "sanroy/fa20-cs3060-hw" repository as a hw9 folder in your repository "yourId/fa20-cs3060-hw"
- 3. Complete the assignment, committing changes to git. Each task code should be in a separate file. As an example, task1.scala for Task 1.
- 4. Push all commits to your Gitlab repository
- 5. If you have done yet done so, sdd TA (username: prabeshpaudel) as a member of your Gitlab repository

## Tasks:

- 1. **Task #1: (20 points)** Scala. Let's get back to Task 2 of the last Scala assignment where we developed a mini web crawler. You know that in Task 2c we did not use parallel computation (i.e. multi-Threaded processing) last time. Your current task is to do exactly that, i.e., redo Task 2c through parallel computation. You need to use the concept of par collection, and concept of functional programming while ensuring that your program is free from side effect. *Writing README carries 2 points*.
- 2. **Task #2:** (20 points) Haskel. Write a Haskell function named myCount which takes two parameters, a list and an item p. The myCount function returns how many times p appears in list. Your function needs to be generic, e.g. should work for integer as well as characters. Test your function as follows and report the result in README.

myCount ['a','b','a','b','a'] 'b' should return 2

myCount [5,1,5,2,3] 5 should return 2

Writing README carries 2 points.

3. **Task #3:** (20 points) Haskel. Haskell recursive type: Write a function lessThan5 which takes a binary tree as input and returns the number of nodes (in the tree) that hold value less than 5. Use the following data type for the binary tree, where each internal node as well as each leaf node holds a value.

data Tree a = Leaf a | BinTree (Tree a) a (Tree a) deriving (Show)

Build a tree of 10 or more nodes with height 3 or more (where each node holding an integer) and apply your lessThan5 function on the tree, and report the output in README file. *Writing README carries 2 points*.
